

# How to play video on iPod nano 7

The iPod nano 7 supports video playback. But it can only play limited video formats. This guide tells you how to convert video to MP4 for iPod nano 7.

Although many people use cellphone to listen to music, I prefer the pure MP3 player as I think it is more portable and has better audio effect. If you want to ask what the most popular MP3 player is at present, I can tell you the answer is the iPod nano 7 without any doubt. Comparing with the previous ones, iPod nano 7 has a big difference in appearance. With the home button and slim body, you may treat it as another iPhone. But the most important improvement of iPod nano 7 is the 2.5 inch big display and video playback support. These make it possess stronger multimedia performance.

But iPod nano 7 is not iPhone. It doesn't run iOS or adopt powerful chipset. That means it can't have strong playing ability. According to the official specification, iPod nano 7 can only play m4v, mp4 and mov video formats with the maximum resolution of 720\*576. And you can't install any third party apps to make it support more formats – like I said before, it's not an iOS device. As you can see, most videos are nonstandard for iPod nano 7. So if you want to enjoy video on it, the best solution is to convert the videos into the standard format. Want to know how to do it? Please continue to view this post.

# Download and install imElfin Video Converter
